Contingent Orders (CO) Overview

There are two main types of orders available on your trading platform:

- Market orders
- Contingent orders Market orders are orders created and sent to the market ready to trade. Contingent orders sit 'outside' the market, and are used to create market orders when certain defined conditions are met

Contingent Order conditions

The conditions of a contingent order are typically based on the market price of a security. In the case of IF DONE contingent orders they can also be contingent on whether a market order trades.

Contingent orders are used to:

- Create market orders when the price of a security reaches a pre-defined level
- Pre-set stops and targets for market orders at the time of placing a market order
- Manage open positions (for example by using a trailing stop with a trailing contingent order)

In their simplest form, (Regular \ FIXED Contingent Order) the price is the condition to trigger the fixed contingent order and create a market order.

Contingent order types

The following contingent order strategies are available:

- Regular \ Fixed Contingent order (Fixed CO)
- One Cancels Other (OCO)
- Trailing Contingent Order (Trailing CO)
- If Done Contingent Order (If Done CO)

Regular \ Fixed Contingent Order

Regular \ FIXED COs let you set a price level for a specific security (contingent security) and provide the details of a market order (security, price, price instruction etc.) that you would like created should the price condition specified be met.

The FIXED CO triggers when the contingent security price level criteria are met and creates a market order based on the details you provided.

FIXED COs provides a strategy to:

- Open a position when price of a security reaches a pre-defined level
- Create a stop or limit, where a market order is created to close an open position when a security's price reaches a certain level.

FIXED COs is used as basic building blocks for more complex contingent orders such as One Cancels Other and If Done contingent orders.

Scenario: Regular / FIXED CO

Strategy:

Buy 100 BHP Billiton (BHP.ASX) (open a long position) if the price the security trades at is 2365 (cents) or higher.

Actions:

Create a FIXED CO with strategy or trigger set for when the price of BHP Billiton (BHP.ASX) is greater than or equal to 2365 (cents).

Result:

A market order is sent, if the FIXED CO is triggered, to buy 100 BHP Billiton (BHP.ASX).

Trailing Contingent Order

The trigger price of a trailing contingent order changes to follow, or trail, the price of a security as the market moves in favour of a position you have opened. This strategy could also be used to take advantage of a reverse in market trend to open a new position.

Trailing COs can recalculate the trigger price upwards in the case of a trailing stop loss on an open bought (long) position, or downwards in the case of a trailing stop loss on an open sold (short) position.

The trigger price of a trailing CO only moves in one direction, which is it will follow price as it moves in favour of an open position, but will remain set if price moves against a position.

Stop loss

Trailing COs are typically used to apply a trailing stop loss.

For example, for a buy (long) position, when the security's price rises to a certain level and then begins to fall, the trigger price level of the trailing stop will rise with price, but remain unchanged as price falls. If market price continues to fall and reaches or falls below the calculated trigger price, a market sell order is created to close the open long position.

Trailing stops can also be used for open short positions, where a trailing CO recalculates the trigger price downwards, and creates a market buy order if triggered, to close an open short position.

The market order should be set as price type Market or similar, to create an order at the current market price at the time the contingent order is triggered.

Scenario: Trailing CO

Strategy:

Place a trailing stop loss on a current 100 BHP Billiton (BHP.ASX) long position, 10 points below current price.

Action:

Create a trailing CO with the strategy, or trigger, set to trail or follow the market price of BHP Billiton (BHP.ASX) with a trailing offset of 10 points below.

Result:

If the CO is triggered, a Market order is sent to sell (close the long position) at the current market price.

One Cancels Other (OCO) Contingent Order

A One Cancels Other (OCO) order uses two contingent orders with different trigger conditions. The contingent orders that an OCO uses can be either a Regular \ FIXED CO or a Trailing CO.

FIXED COs can be used as set profit taking orders or stop loss orders, and Trailing COs are often used to provide a trailing stop.

When either contingent order triggers, the other contingent order is automatically cancelled. OCO orders can be used for the strategy of creating both a profit target and a stop when a market order is placed.

Scenario: OCO

Strategy:

You bought 100 BHP Billiton (BHP.ASX) at the price of 2365 cents. (A market order has traded and you have an open long position) Your strategy is to buy BHP Billiton (BHP.ASX) at this price, expecting that the security's price will rise.

If the price of BHP Billiton (BHP.ASX) falls to 2325 cents you want to close or cover the position to prevent further losses. You may choose to use a market type price instruction when leaving a stop loss in case the market trades through your stop level to ensure you don't miss the market.

If the price of BHP Billiton (BHP.ASX) rises to 2410 cents, you want to close the position in profit.

When either of the stop loss or take profit conditions is met then the other order will be automatically cancelled.

Action:

To execute this strategy you need a stop loss order at 2325 cents, and a take profit order at 2410 cents.

Set the stop loss order

The first contingent order is set as a stop loss order using a Regular \ FIXED CO.

- The trigger condition or strategy is that the security price of BHP Billiton (BHP.ASX) trades less than or equal to 2325 cents.
- The market order to be sent if the CO is triggered is to sell 100 BHP Billiton (BHP.ASX) at 2322 cents to close out the long position.

Set the Take Profit order

The second contingent order is set as a profit target order using a Regular / FIXED CO.

- The trigger condition or strategy is that the security price of BHP Billiton (BHP.ASX) trades greater than or equal to 2410 cents.
- The limit order to be sent if the CO is triggered is to sell, or close out the long position at 2412.

IF DONE Contingent Order

IF DONE COs are placed as part of a market order and depend on the market order trading. When the market order partially or fully trades, the contingent orders become active.

IF DONE COs enables strategies such as applying stops and/or profit targets to a market order at the time of market order creation.

An IF DONE CO can be configured using a combination of Regular \ Fixed, Trailing and OCO orders.

Scenario: IF DONE Order

Using the strategies outlined in the previous examples:

- The strategy is to buy 100 BHP Billiton (BHP.ASX) at 2365 if it rises to this price.
- A trailing stop loss is to be set 10 points below the current price.
- Profit to be taken at 2410

The complete IF DONE contingent order contains:

- A FIXED Co, to trigger the initial market order
- A One Cancels Other (OCO order) containing
 - a trailing stop (Trailing CO)
 - a Profit target (FIXED CO)

Creating Contingent Orders

Contingent orders are created using Order Entry and selecting the various condition strategies and protection options.

Condition Strategy

► Condition strategy:

None Regular Trailing OCO

There are four options within strategy section of the Order Entry

- None – Used to create standard non-contingent orders
- Regular – Used to create Regular / FIXED COs
- Trailing – Used to create Trailing COs
- OCO – Used to create One Cancels Other (OCO) COs

Protection Options

There are two protection options

- Protect against losses
- Protect profit

► Protect against losses :

Stop Loss Strategy None Regular Trailing

Price 2320 Price
